

How Huawei's Solutions Address the Challenges of Powering ICT Network

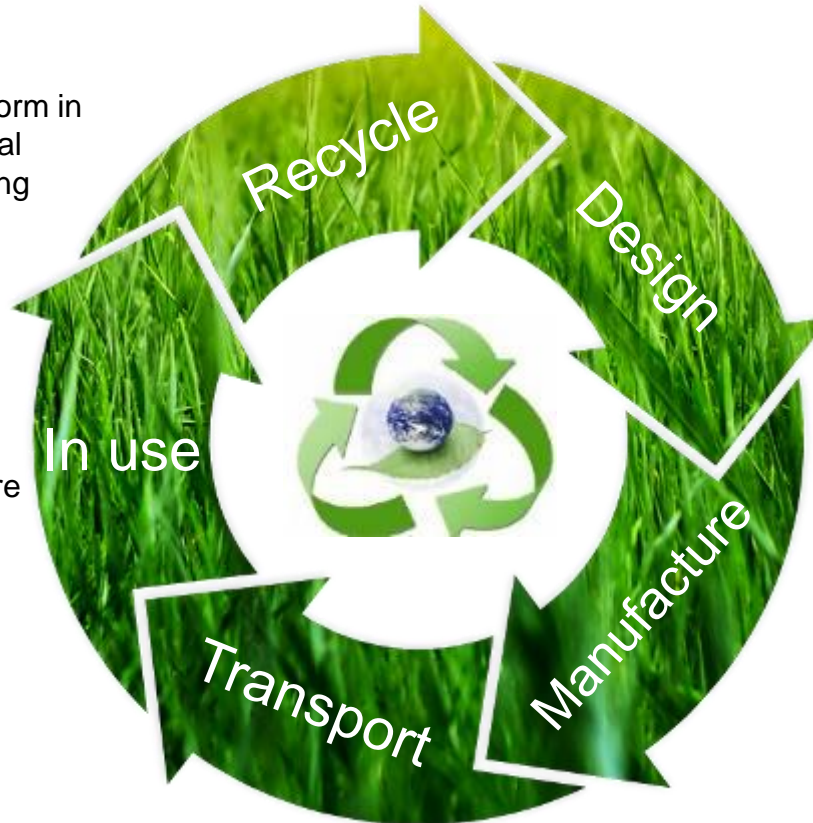

www.huawei.com

HUAWEI TECHNOLOGIES CO., LTD.

Reducing environmental impact throughout product life cycle

- Global recycle platform in partnership with local professional recycling companies and organizations
- A total of 8,000 base stations powered by hybrid resources were deployed in 2010

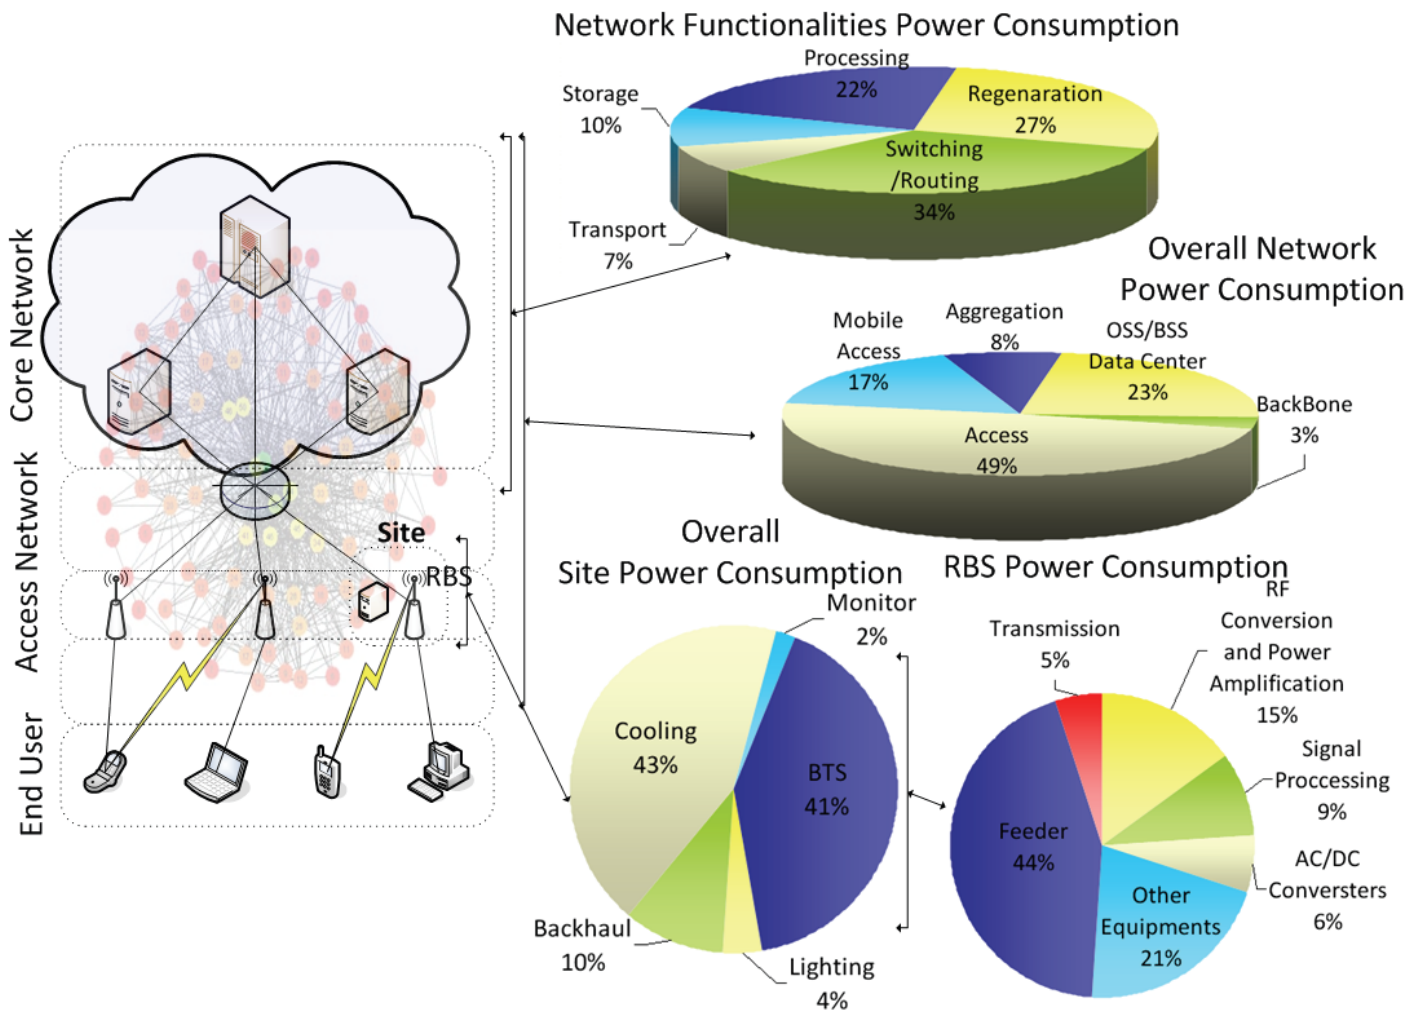

- Reusable green packages

- Active participation in industry standards : ITU-T, ATIS , ETSI , JRC ,Energy Star and CCSA etc.
- Set up internal Eco-Design label certification standards
- Conduct LCA for major products
- Reduction of 30% CO2 emissions in two years
- Green Product Certification Program and Green Supply Chain Certification Program

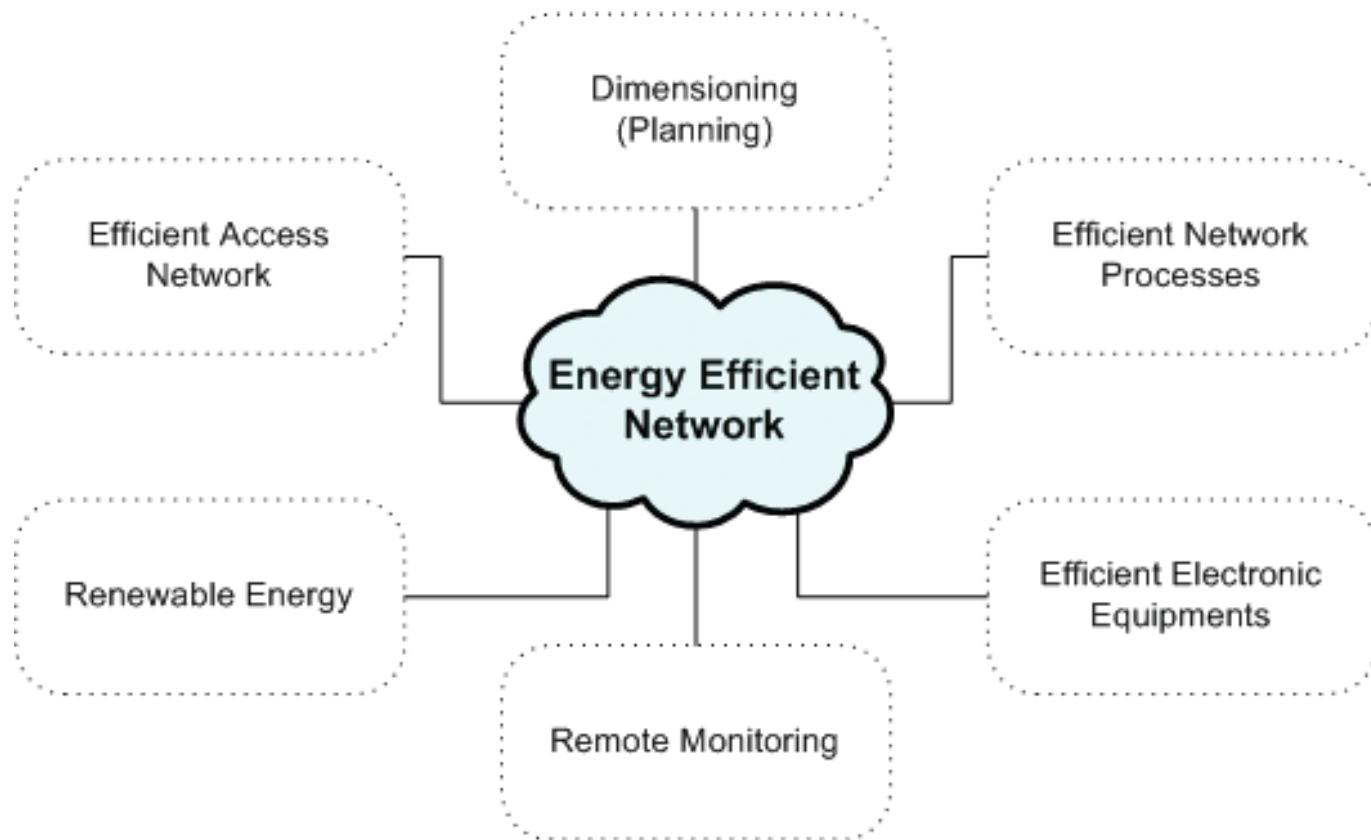

~70% of carbon emissions occur in the operating phase of communications products

Power consumption in different layers of the network.

Energy efficient solutions of telecommunication networks

Picture taken from Koutitas and Demestichas: A Review of Energy Efficiency in Telecommunication Networks

Case study: high density BTS helps China Mobile reduce energy consumption and footprint

Before swap, 5 racks

After swap: 1 rack

- Reduce **80%** footprint
- High density & high energy efficiency (shutdown tech.) enable **~30%** power savings

Case study: Vodafone Spain cuts power consumption by 66.85%

SingleRAN

Power consumption savings of 66.85%

- Substantially cutting power consumption, while ensuring network performance
- Enable Vodafone Spain to save over 1.98 million euros/1000 base stations annually (estimated based on the power fee in Spain)

Case study: Telefonica significantly cuts energy consumption through dynamic traffic control

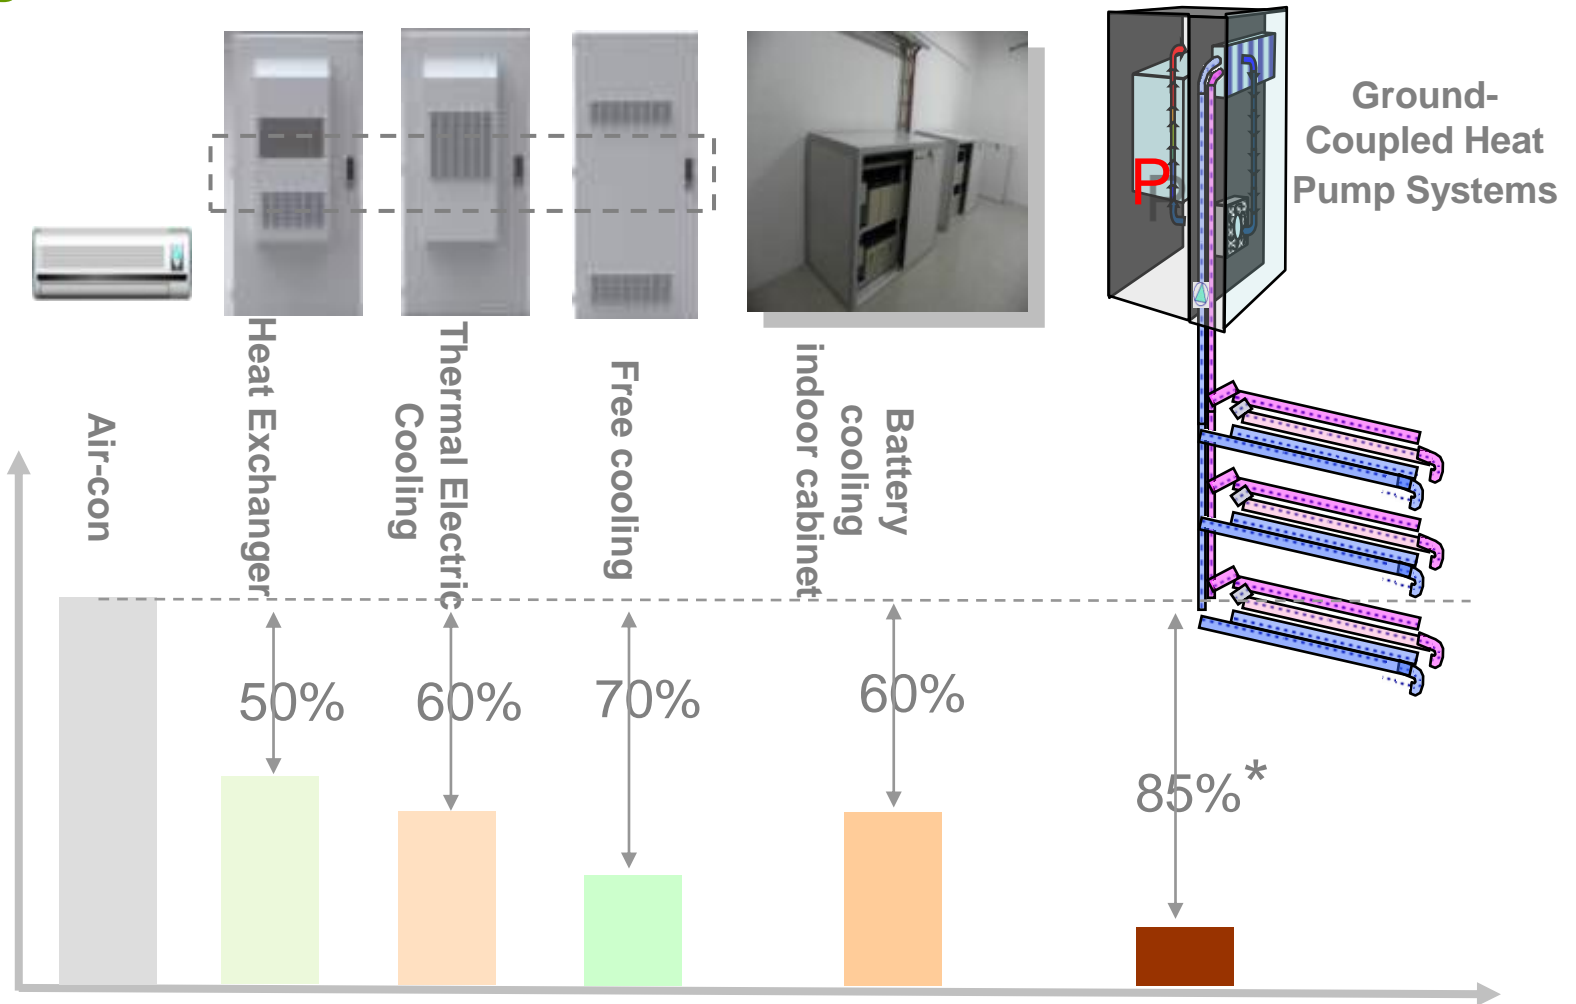

- Before dynamic traffic control adopted: 26.44127 kWh
- After dynamic traffic control adopted: 21.03408 kWh
- Result: 20.45% energy consumption cut

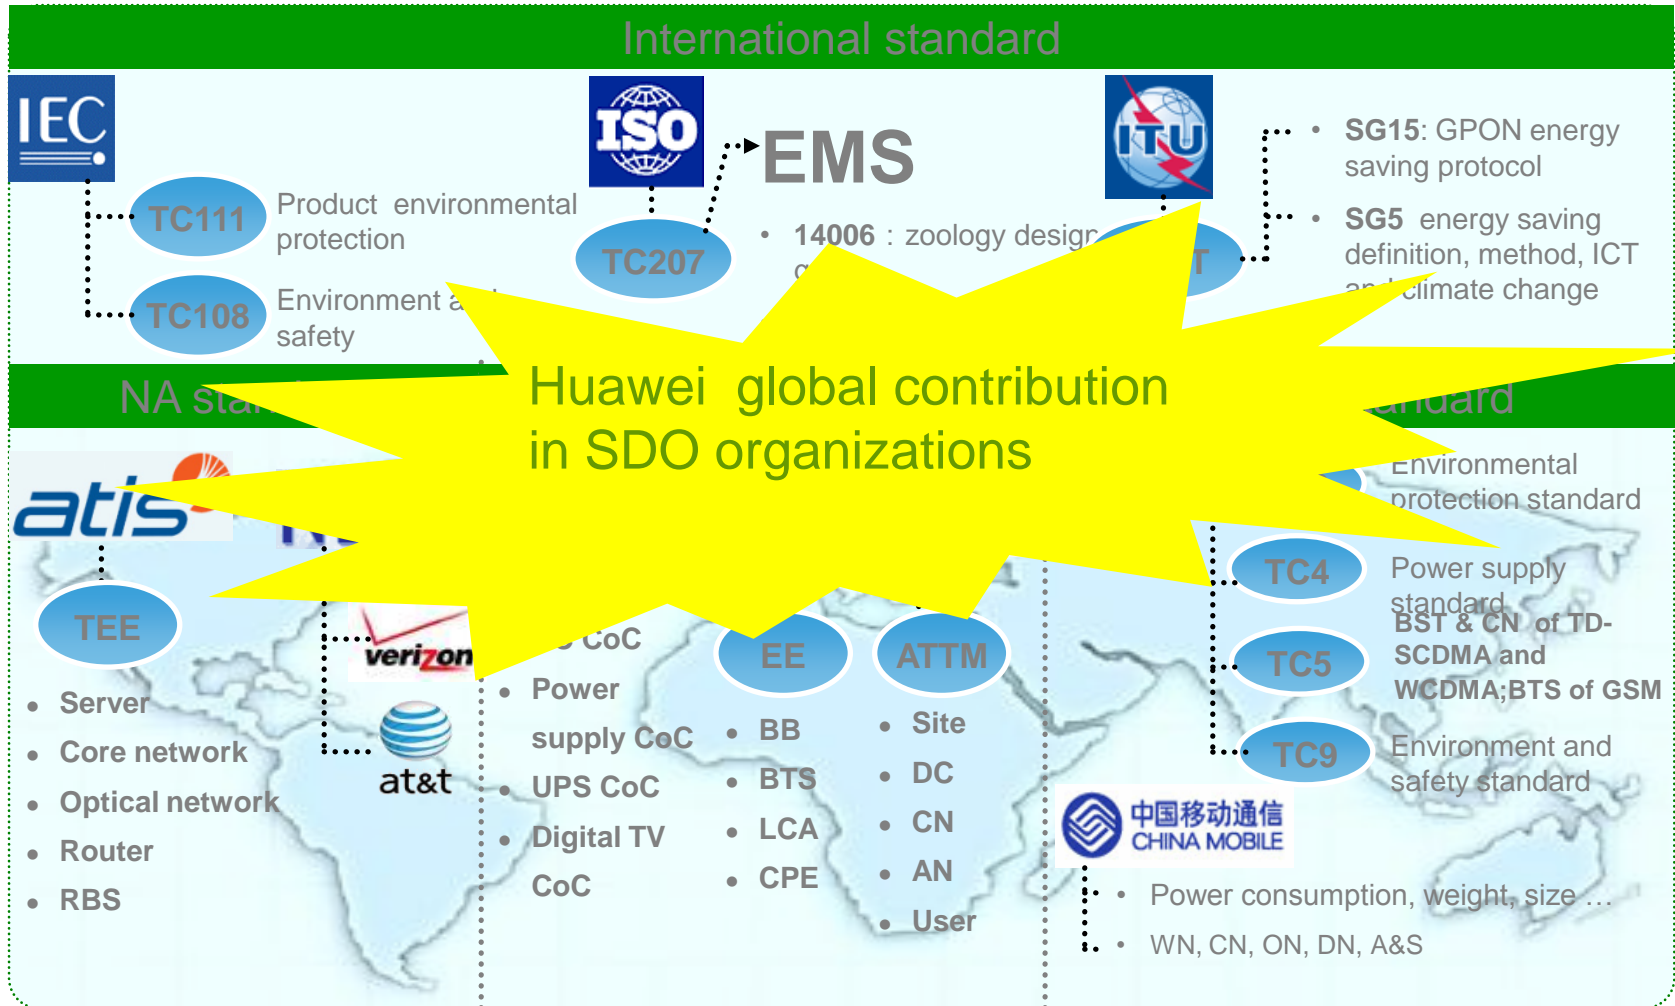

Infrastructure solution

For 1 kw site
save 4
kwh/year

Cooling Solution for Different Scenarios

The need of standardardization

Thank you
