Facts

FACT - I eGov It's a highway to hell...

FROM IDEA TO FUNCTIONALITY

FACT - II

**DEALING WITH CONFIDENTIALITY,
INTEGRITY, DISPONIBILITY, PRIVACY**

FACT - III

DO YOU THINK YOU'RE RIGHT ?

Start Q&D Development

- Develop an application:
 - > **everybody** knows how to do!
- Develop a **secured** application:
 - > some knows how to do...
- Develop a **secured web application**,
with **quality** and **efficiency**:
 - > hummmm...!

SSL (Secured Socket Layer) is today the standard commonly adopted to transactions security but it remains permissive and suffers from serious gaps of implementation which goes against several fundamentals security principles.

Using SSL over HTTP, **you leave to the browser the most critical steps** to initiate the encrypted communication with the e-service, including numbers generation, the choice of the session key (including its length), the algorithm use and so one.

Furthermore, the **fundamental base** in **cryptography** is the need for **Randomness** but computers are completely deterministic...

So, you don't have any control of these fundamentals security elements, there is a serious security issue!

SSL TRUTHS

SSL^{ed}

NOT
PROTECTED

...the sad truth of these undetectable
“man-in-the-middle” attacks against SSL.

Interception and modification on the fly
are easily performed today.

Client-side Vulnerabilities

- C1. Web Browsers
- C2. Office Software
- C3. Email Clients
- C4. Media Players

S1 Web Applications

S1.1 Description

Web-based applications such as Content Management Systems (CMS), Wikis, Portals, Bulletin Boards, and Discussion Forums are used by small and large organizations. A large number of organizations also develop and maintain custom-built web applications for their businesses (indeed, in many cases, such applications are the business). Every week hundreds of vulnerabilities are reported in commercially available and open source web applications, and are actively exploited. Please note that the custom-built web applications are also attacked and exploited even though the vulnerabilities in these applications are not reported and tracked by public vulnerability databases such as @RISK, CVE or BugTraq. The number of attempted attacks for some of the large web hosting farms range from hundreds of thousands to even millions every day.

Server-side Vulnerabilities in:

- S1. Web Applications

- A1. Instant Messaging

- A2. Peer-to-Peer Programs

Multiple remote code execution vulnerabilities have been discovered in the anti-virus software provided by various vendors including Symantec, F-Secure, Trend Micro, McAfee, Computer Associates, ClamAV and Sophos. These vulnerabilities can be used to take a complete control of the user's system with limited or no user interaction.

- S3. Database Software
- S4. Management Servers
- S5. Anti-virus Software
- S6. Backup Software

- S7. Zero Day Attacks

Zero Day Attacks:

- M1. Web Servers and Proxies

Exploitation of Vulnerabilities

FACT - VI

> THE CURE IS OFTEN **WORSE THAN
THE DISEASE !**

FACT - VII

SECURITY IS NOT A GAME FOR US
